

TCOLOR --Subprogram

TCOLOR

Format

CALL TCOLOR(foreground-color,background color)

Cross Reference

PALETTE

Description

The TCOLOR subprogram enables you to change the foreground-color and background-color of text characters.

In bit map modes, the color set for a given portion of text remains even when subsequent text is changed.

In text modes, when colors are changed, all text is changed at the same time.

Color numbers range from 1 to the number of colors available to the mode(4,16,256). See PALETTE

Example

```
100 CALL TCOLOR(16,5)
```

This sets the foreground-color to white and the background-color to dark blue.

This is the default color when you enter MYARC Advanced BASIC.
