PRESIDENT'S CORNER

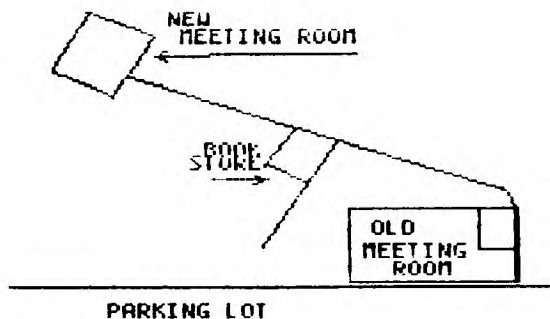

Charles Strobell

Another month is done and this brings us to this month's newsletter. For starters this month's meeting will be held not in our usual spot but at the end of the hall. It was discussed and voted on being that our size has shrunk to ten or fifteen we didn't need such a large meeting room. So this month go all the way down the hall to the end to attend the meeting.

THIS MONTH WILL BE THE USUAL CLUB DISKS, 50/50 DRAWING, AND THE DEMOS, IF ANY. NO PENDIUM WILL ALSO BE ON SELL AT THE DISK SELLS TABLE.

With this I will close, and see you at the meeting at nov. 10, 1990.

THIS IS A VERY CRUDE MAP OF WERE THE NEW MEETING ROOM WILL BE AT.

ED. NOTES **

Coming this month we should have some topics on how to use Ti-Writer at the meeting so be there.

Most of the articles in this issue has mostly items for the 9640, sorry about this but again I have gotten very little from the membership in the way of articles and a person has to use what has. So if you have anything send it to me or you might wake up one of these days and find were has it all gone. As they say you don't what you have missed until it's gone.

See you all at the meeting at 12:30pm. Sat 10, 1990...

program

Well another month is upon us with our club. What shall we do? What shall we attempt to do in the year to come? Some ideas were brought up last month, one was to define a direction we should go, as a club to keep things interesting. I asked if any one would be interested, as a matter of fact, how many knew anything about TI-WRITER and I was amazed at how many people in our club didn't even know how to use TI-WRITER. This explains why I don't get very many articles for the news letter. This is a shame as there are many products made for the Writers to even include Graphics. I believe Earl brought up that Multi-Plan should also be studied. I also agree, how many know that you can use files from one of the software packages in the other? Such as a spreadsheet in a writer file. What are thoughts of the above? Bring them to the meeting and express yourself.

Another issue that I thought you should think about is who is going to run for office for 1991. We are looking for some good person's to fill these offices. Please give it some thought. No officers NO CLUB get it.

I found a TI-BBS in one of our exchange newsletters. It was from the Saint Louise Club. Their board is very nice, it has two Hard drives, a 10 and 20 mg. One directory is for TI software, another is for the Geneve, and still another covers Graphics of all kinds. For those interested there No. is 1-702-648-1247 it covers 300,1200,2400 bd. The board is run 24 Hrs. a day 7 days a week.

Give you some kind of files for the download on this BBS there is a Tips loader for Mdos. is a Tips loader you ask? Well on a few of the of the computers around is a graphics format call Print Shop which is the main graphics program for PCs. and the C64. What it looks like is some one has found a way to use PC-Transfer with a utility file to get two files in TI format. One file is a script file the other is a very long file with all the graphic information. Then you load another file in my case called GTIPS-1, BY THE WAY THIS IS THE MDOS VERSION, I understand there is also a 89/4A a version also. It first ask for the drive that has all the Tips files on then lists all the script files to the screen. Then asks which one you want, by typing in the name of the file you wish it then asks if you wish to view all the graphics names in this set. Typing Y at this point will scroll them up the screen, and pressing any key to pause to read the picture names. When this is done it will ask for an out put drive, just type in 'DSKn.' the small n stands for the number of the drive. To start the conversion. Know to convert the files, the program will ask you were from the list just scrolled do you want to start. After typing in the first name the program searches for it then tells you it found it. Then it asks a name you wish to call it. Remember use only 8 characters as the program inserts a '_1' at the end to be used in Ti-Artist. Once the files are converted they can easily be convert to CSGO or PAGEPRO for your own

graphics library.

SET DISK CONFIGURATION
UTILITY VERSION 1.0

(c)1990 Bruce Hellstrom

This archive is being distributed as FAIRWARE. If you like and use this product, please send whatever it is worth to you to the address listed at the end of this documentation.

OVERVIEW

----- This utility will allow use of 80 track drives and individual control of the head step times for each drive connected to the Geneve 9640 computer. It has only been tested with a TI controller but should work for all controllers, since the ability to format in 80 tracks is built into MDOS. It can only be used if your drives support 80 tracks. I have tested this with both versions .96H and 1.14F of MDOS. Earlier and later versions may require an update to achieve compatibility. & This archive contains the following files:

SETDSK-CFG - A configuration program to configure the program for your particular disk setup
SETDSK-COM - This is the actual program that changes the head step times and tells MDOS what drives you have connected.

SETDSK-DOC - This documentation file.
CONFIGURING YOUR SYSTEM

You start by running the SETDSK-CFG file. This is accomplished by just typing SETDSK-CFG at the MDOS command prompt. Both the SETDSK-CFG and the SETDSK-COM files must be in the same drive and directory and you must be using the current working drive as the SETDSK-CFG program will only search the drive and directory it was loaded from. You will get an error message if the SETDSK-COM file cannot be

located. Upon entry into the program you will see the current head step times and track specifications that are in the SETDSK-COM file. To change these settings, simply select the drive number you wish to configure (1 to 4). The cursor will then move to the head step time for that particular drive. You may enter a value from 0 to 3 with 0 being the fastest step time. Most newer drives can handle a speed of 0 but if your drive can't seem to locate files or you don't hear the heads moving at all, you may need a slower time. The MDOS default is 2 which is approximately 20ms with the TI controller or 10ms for the Corcomp. A step time of 0 is equal to 6ms on the TI or 3ms for the Cor-comp.

*note - at all entries, you must enter a number. The enter key is not active. After entering your head step time, the cursor then moves to the number of tracks for the drive selected. You may enter either a 4 or an 8 here to signify 40 or 80 track drives. After entering the number of tracks, the cursor moves back down to the drive selection prompt and you may enter a new drive to configure or press S to save the settings you have entered. Pressing Q will exit the program without changing any of the values. TRYING IT OUT

----- Once you have tailored your system, you are ready to try it out and test to see if the head step times are compatible with your controller. At the MDOS command prompt type: SETDSK-COM. The program runs very quickly and now MDOS knows about your disk drives. To format a

NEW HORIZIONS PAGE(7)

disk in 80 tracks, you need the /8 parameter after the drive name, for example:

FORMAT A:/8 If

you are using a double density controller, you still also need the proper sector parameter that you usually use, such as:

FORMAT A:/8 /16

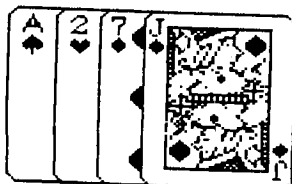

As said previously, if your drive seems to sound like it can't find a sector or you can't hear any movement of the heads, try adjusting the head step times until you find a suitable speed.

Once you have a setup that you like, the easiest thing to do is include the SETDSK-COM command in your autoexec file so that it is always loaded upon powering up your system and will be re-loaded upon a CTL-ALT-DEL since MDOS resets it's default values when encountering a warm boot. You can also still just type the command from the command line if for some reason you aren't booting your autoexec file.

The SETDSK-CFG file will not be needed unless you need to reconfigure your system. Please send any

comments or questions to the following address:

GETKEY - Version 1.0,
August 31, 1989 - Barry
Boone.

This is a short program that functions as an external MDOS command used from within BATCH files. The program will wait for the user to press a key, then store the keypress in batch argument %1. What this means is that your batch files may now be interactive, and VERY flexible. The distribution archive contains 4 files:

AUTOEXEC - The AUTOEXEC file I use on my system that demonstrates the usage of the GETKEY program will be

GETKEY - The GETKEY program itself

GETKEY-S - The source code to the GETKEY programd line if for

GETKEY-DOC - This file

If you distribute this program, please distribute it in its original form, with program, source, docs, and sample BATCH file.7055 N.

USING GETKEY

GETKEY runs as a batch command. An example of its use is the way it is used in the following batch files:

```
ECHO Press 1 for TELCO,
2 for Archiver III
:LOOP
GETKEY
IF %1==1 GOTO TLOAD
IF %1==2 GOTO ALOAD
GOTO LOOP
:TLOAD
EXEC TELCO
GOTO END
:ALOAD
```

EXEC ARC3 Upon entry
:END the program you will
GETSTR - Version 1.0,
The above batch file
would ask you to press 1rt
or 2, and then wait foras
a keypress. If the keypres
is a 1 or a 2, it branches
to the line that runs the
appropriate program,
otherwise it loops and
waits for you to press
another key. The AUTOEXEC
file included with this
archive further
demonstrates just how
powerful and flexible this
capability can be.
Incidentally, GETKEY will
