MICROpendium (ISSN 10432299) is published monthly for \$35 per year by Burns-Koloen **Communications Inc., 502 Wind**sor Rd., Round Rock, TX 78664-7639. Second-class postage paid at Round Rock, Texas. POSTMAS-TER: Send address changes to MI-CROpendium, P.O. Box 1343, Round Rock, TX 78680-1343. No information published in the pages of MICROpendium may be used without permission of the publisher, Burns-Koloen Communications Inc. Only computer user groups that have exchange agreements with MICROpendium may excerpt articles appearing in MICROpendium without prior approval. While all efforts are directed at providing factual and true information in published articles, the publisher cannot accept responsibility for errors that appear in advertising or text appearing in MICROpendium. The inclusion of brand names in text does not constitute an endorsement of any product by the publisher. Statements published by MI-CROpendium which reflect erroneously on individuals, products or companies will be corrected upon contacting the publisher. Unless the author specifies, letters will be treated as unconditionally assigned for publication, copyright purposes and use in any other publication or brochure and are subject to MICROpendium's unrestricted right to edit and comment. Display advertising deadlines and rates are available upon request. All correspondence should be mailed to MICROpendium at P.O. Box 1343, Round Rock, TX 78680. We cannot take responsibility for unsolicited manuscripts but will give consideration to anything sent to the above address. Manuscripts will be returned only if a self-addressed stamped envelope is included. Foreign subscriptions are \$40.25 (Mexico); \$42.50 (Canada); \$40.00, surface mail to other countries; \$52 airmail to other countries. All editions of MICROpendium are mailed from the Round Rock (Texas) Post Office. Mailing address: P.O. Box 1343, Round Rock, TX 78680. User Notes

Getting more lines out of the formatter, making electronic conversation, and a few things computer users say that may give you a chuckle

***READ THIS**

Here are some tips to help you when entering programs from MICROpendium:

1. Most BASIC and Extended BASIC programs are run through Checksum, which places the numbers that follow exclamation points at the end of each program line. Do not enter these numbers or exclamation points. Checksum is available on disk fror ' MICROpendium for \$4. 2. Long Extended BASIC lines are entered by inputting until the screen stops accepting characters, pressing Enter, pressing FCTN REDO, cursoring to the end of the line and continuing input.

TEX-COMP HAS SLASHED PRICES ON THE BIGGEST & BEST COLLECTION OF FREEWARE FOR THE 99/4A. NOW ONLY \$2.95 PER DISK WITH A 5 DISK MINIMUM. CHOOSE FROM HUNDREDS OF GREAT PROGRAMS. NO EXTRA CHARGE ON PROGRAMS THAT REQUIRE MORE THAN ONE DISK SIDE. ALL PROGRAMS HAVE BEEN TESTED AND ALMOST ALL HAVE BEEN PROVIDED WITH EXBASIC AUTOLOAD. CHOOSE FROM THE BEST IN GAMES, UTILITIES, GRAPHICS, HOME & BUSINESS AND DISK BACKUPS OF DOZENS OF YOUR FAVORITE MODULES THAT ARE NOW OUT OF PRODUCTION.

COPPENT5

Waiting for SCSI

I'm waiting for a SCSI card to arrive from Bud Mills. I'd like to review it as soon as possible. However, there may be some readers who already have it running on their Geneves. It that's the case, I invite you to send us a report of what you think of it. As a Geneve owner, the SCSI card is high on my wish list.

Unlike some users I've spoken with, I'm not interested in its abilities to access CD-ROM drives. Having it available to control a SCSI-1 and SCSI-2 hard drive is plenty for me. For now, at least. If Santa Bud is listening, this would be a great Christmas present.

A GREAT LITTLE LAPTOP

We're publishing a lengthy treatise on the forgotten notebook computer, the TI CC40. Written by Charles Good, the article presents a convincing case for the tiny, incredibly efficient notebook. Even though TI never developed the potential of this computer, it's hard not to be intrigued by its possibilities. Charlie seems to enjoy it immensely. And why not. The CC40 will go a couple of hundred hours without replacing batteries, never mind recharging.

Meanwhile, if you've got one running on your Geneve, tell us about it so we can tell everyone else.

GOING OFF OF COMPUSERVE

After January, readers won't be able to reach via CompuServe. TI subscribers to CompuServe know that its TI forum is the least active of all the electronic services. There are good reasons for this, the first of which is the cost. We can still be reached via Delphi, GEnie and the Internet, so there's no problem with accessibility. We're just trying to save a few bucks. If you've ever seen one at a flea market or computer fair and wondered whether it was worth the few dollars that was being asked, the article may resolve your question into a resounding "YES."

HAPPY HOLIDAYS

Laura and I want to extend holiday greetings to all of you as our 11th year slowly comes to a close. It's hard to believe that we've been meeting like this for that long. Thanks for all your support. It never fails to put a smile on our faces.

FEEDBACK

'Hoax' a misnomer

As an ex-user of the 99/4A, 99/8 and the Geneve 9640, I still stay current with the TI community. The reason I'm writing is this: I was told by a subscriber of your publication that there was an article about a hoax regarding Texas Instruments developments, namely the 99/5 "Waxwing 5," the 99/8 "Armadillo" and so on. Well, I used to own a 99/8 with all the Hex-Bus peripherals (wafertape, printer/plotter, 80column printer, 5.25-inch DS/DD disk drive/controller, 300-baud modem, RS232 interface and the Video Interface for the CC40) and the schematics for each including the 99/8 itself. These were sent to me by Mike Bunyard of the Bunyard Manual fame with his own personal notes regarding the "Armadillo" project. I've held in my hands one of the very few "Waxwing 5" motherboards and have a copy or the schematics and I have photographs of the motherboard. I've owned such peripheral cards as the IEEE-488, EPROM programmer card, the Super Modem card, the 128K card and TI's DS/DD card. So, as far as a hoax goes, I don't know about that! It seems to me that someone is very misinformed or I was told the wrong thing by my friend.

TI99/4A home computer has come from the early '80s to the present "State-of-the-Orphan" that it is today. We accomplished this by demonstrations and displays: Genealogy histories printed via the 99/4A and Beyond Wordwriter cartridge; displays of T-shirts with graphics from Page Pro; hard drives for the 4A; Cor-Comp sidecars; and a demonstration of the TI-Emulator conversion program. And in between demonstrations and displays, there were several

has a feature called "View Pages" which emulates the WYSIWYG screen with some additional features that are beneficial to a newsletter editor in adjusting the location of text and graphics before printing. One can readily recognize what a paper saver this tool proves to be.

If the editor needs to compare the space required for different printing options he/she needs only to load the text into the Editor and enter or alter the options as desired: ".P1" for pica one column; ".P2" for pica two column; ".C1 for condensed one column; or ".C2" for two-column condensed. Also, special character codes permit the choice of elite type in any of these four stated options. All these options can be exercised at any point in the text file as often as desired. When finished, one saves the text file to disk, leaves the editor and selects Option 2 on the screen, which is the printer program menu. Now select Option 3 for configuration and then Option 2 for VIEW PAGES. The file will be displayed (imitated) on screen and depicts the page space required for the options exercised. A format file can be created which links several files together including graphics and permits one to view or print continuous pages of an entire newsletter. As I view the entire program, its only limitation is that all graphics must be processed in the pica one-column mode and this limits the use of graphics in two-column options. We here at K-Town have used this program for years and would find it difficult to believe it to be inadequate in any manner. True, errors sometimes show up in our printed copy, which is no fault of the software. These errors are the result of poor editing combined with time limitations relative to publishing deadlines. If anyone has any problems with Art's Newsletter Printer software (not to be confused with First Draft) I will be glad to help resolve the problem if the individual will contact me after reading the instructions packaged with the software. Also, I will send anyone a copy of the software for the sum of \$3 to cover copying and mailing fees. Be sure to include a legible name and address. For either offer contact me, E.N Smith, at 3506 Garden Dr., Knoxville, TN 37918. This is the same address used by the K-Town Users Group E.M. Smith Knoxville, Tennessee

different kinds of cookies, coffee, cold drinks, etc.

Reunion a hit

Just wanted to drop you a note to say "Thanks" for the excellent coverage you gave the Dallas TI Home Computer Group (DTIHCG) regarding our Reunion Oct. 29 at the Infomart in Dallas. By publicizing our Reunion in the September 1994 issue of MICROpendium (page 4) and again in the October issue (page 12) you really helped us to get the word out. Several attendees came up to me and said they read about our Reunion in the MICROpendium. Your write-up really helped. We had a turnout of between 65 and 75 dedicated 99ers. And, as a result, we had several former members rejoin our group and also picked up four new members. We feel the Reunion was a great success. Many former members attended and we all enjoyed the visiting each other and reminiscing about the old days. Plus, this gave us an opportunity to show how far the I've enclosed a photo of Mike Stanfill who came dressed as a 99/4A sitting atop a file cabinet, P-Box and disk files. This was a highlight, with Mike going around the room saying, "Hey, what are you looking at?" or "Did you lose something?" We all got a big laugh out of Mike's shenanigans. So, in closing, let me thank you again for the great coverage you gave our Re-

union; we all really appreciated it. Dan M. Lowe, President Dallas TI Home Computer Group Garland, Texas

Newsletter notes

In the November issue you published a review by Dr. Charles Good of Newsletter Editor and Formatter by Bill Gaskill. In the review Dr. Good rightly stated that Art Gibson's Newsletter Printer software does not have a WYSIWYG (what you see is what you get) screen. Persons not familiar with Art's software might consider that a shortcoming, when in fact Art's software

MONTECOLOR Like solitaire, but without the cards

By LUCIE DORAIS ©1992 L. Dorais

Another year... my fifth... After a quiet summer? Not exactly, as I purchased a PC laptop last May. And while I did spend much time playing with it, I found that it renewed my interest in Tex. How? Just as I was really running out of inspiration for my column, I got ideas from PC programs. One shareware disk I got for the PC is SOLMENU1, a collection of solitaire card games by Karl Meadows. I had always wanted to write solitaire games, but it seems that Regena did them all in MI-**CROpendium**. The ones I found in a book I own I did not find interesting enough, or too easy to play. Well, SOLMENU provided me with five new games to play; I especially like CANFIELD, so I wrote a TI version.

Lines 220-240 redefine more graphic characters: Arrows (140-143) and space bar (139) for the menu, cursor (137) and a flag (81) that shows a card has been marked. A\$ and HD\$ are here temporary variables.

number of pairs found in each game. The dots displayed at the bottom of the screen by line 340 show the total pairs you must find to win (26); each time you find one, a dot will be replaced by a "gold coin" in the string OK\$.

Another game, MONTE-CARLO, I found easy to program, but a bit boring to play, until I read about a shareware PC version that replaces the cards with colored squares (called SOLISQUARE). You have to remove cards from the tableau in pairs; the cards must be adjacent either vertically, horizontally, or diagonally. The colored squares make it easier to play, since is it easier to spot colors than card values; but, more importantly, it allows the game to be played by young children. Full instructions are at lines 820-870 (GO-SUBed from line 140). Since a card deck has four suits of 13 cards, we use 13 colors, starting at No. 4 to avoid middle green. That makes the use of text a bit hard. After much planning, I devised a colorful menu by redefining the needed letters in different color sets (one set for each menu item). In DATA lines 120-130, the first number is the character

The deck, four cards for each suit/color, is built by lines 200-210, by using the first character of each set and adding it four times to DK\$. The menu is displayed by lines 260-280 at the right of the screen (meaning in English given as remarks. The screen will show it in uppercase.).

You have to remove cards from the tableau in pairs; the cards must be adjacent either vertically, horizontally, or diagonally. The colored squares make it easier to play, since is it easier to spot colors than card values; but, more

To draw the 25 cards on the screen, HD\$ is read character by character (card by card), then we CALL GET the corresponding row and column for each card, derived from its Xth position in HD\$. Then the card character K found at position X is put on the screen in a 3x3 square. The rest of line 380 initializes some variables after each new deal: R,C are for the cursor, PIK tells Tex how many cards have been marked so it knows when to go and check for a pair. The main CALL KEY (line 400-410) and the cursor movement (lines 420-470) are easy to follow. When you move at the end of a row, you end up at the beginning

importantly, it allows the game to be played by young children.

The shuffle routine comes from another TI solitaire game I own, "Solitaire" by Ben Elizer (Compute, January 1986). I am not sure how it works, but it is much faster that randomly finding 52 cards, checking each time if it has been found before, a routine which drags towards the end. Here, the random function is called exactly 52 times. The shuffled deck is built into A\$, then copied into DK\$. From it we take the hand (HD\$) of 25 cards that will be first dealt on screen. PD is the position of the next card in DK\$ to be taken when we ask for a new deal. T1 is a temporary variable for line 360, R1 and C1 temporarily hold the cursor position after a shuffle (upper left card). G is the number of the game: After each session you are given back a summary of the games played. The maximum number of games per session is 60, but you can change the DIM GP(60) in line 140 for more (!). OK\$ will hold the

of the next row (be careful, the check-key string in line 400 contains a space).

You mark a card, which you think forms a pair, by pressing the space bar. The CALL KEY will bring you to line 490. If the spot is empty (card removed), Tex beeps and returns you to line 400. If the card has already been marked, i.e. it has a flag (three arrows) left to it, the flag is erased, PIK is reset to zero, and back to the CALL KEY. (Here's a clue: If you mark a first card by error, just press space to erase its flag). If the card is valid, PIK is incremented to one or two, and Tex flags it in relation to the cursor: Next row, two columns to the left (the card positions are kept in R1,C1 and R2,C2). If only one card has been marked (PIK=1), we go back to CALL KEY for the second one. Otherwise, Tex automatically goes on to check if you marked a pair. To successfully form a pair, the cards must be adjacent. The difference between (See Page 8)

to be CHARPATed, the second is the new character. The letters are redefined in that order: (line 120) K,T,M,O,V,E,A,R; (line 130) N,E,W,D,A,L,F,S,H,). We do K first because we use it for T right after, so we can display "INIT" in line 190 (I and N are not changed, being in the right color set).

MONTECOLOR---

(Continued from Page 7) their rows or columns must be four, since each card takes three rows, plus an empty row between the cards. To check that, we use temporary variables T1 and T2 to hold the difference between columns C1/C2and rows R1/R2, respectively (line 530). Since the cards are not marked in any order, that difference can be positive or negative, hence the use of the ABS function (absolute value). Here T1 and T2 get a value resulting from a "relational expression," which explains the parentheses they are set to zero if the relation is not true, or to -1 if it is true. These values will both be true if the cards are adjacent diagonally. If they are in the same row (R1=R2) or column (C1=C2), T1 or T2 will be zero, so line 540 checks all possibilities: same row and adjacent columns (T1), same column and adjacent rows (T2), or adjacent rows and columns (diagonals, T1 AND T2). Note that we don't have to write IF T2 \diamond 0, since IF T2 automatically checks that T2 is not zero. If the pair is not adjacent, Tex goes to line 600 to erase the two flags and sound some sour notes (CALL) S); PIK is reset to zero. If the cards are adjacent, Tex then checks the color: T1 and T2 take the value of the upper left characters of the two squares. Of course, if they form a pair, they will be the same. If not, more sour sounds. Okay, a pair has been found. Tex erases both cards and their flags in two CALL ERs, and replaces those cards with asterisks in the hand string HD\$ (CALL) FLAG). OK\$ is incremented by one "gold coin" (char. "f") and displayed for its length with a nice chime sound. The remaining dots stay on screen to remind you how many more pairs you need to find! If you found the 26 pairs (52 cards), Tex will go straight to line 720 to shower you with random sounds and minimal visual effects.

tack the top ones and, therefore, make the predicting more difficult! (Yes, there is some strategy to that game, it is not all boring, automatic play as you might first think.)

When you press "N" for a New Deal, the spots left in the hand (and on screen) by the removed pairs are filled up by the next card in the hand. Of course, if there is no empty spot, Tex knows it, since there is no asterisk in the hand yet, so it beeps and returns you to the CALL KEY (line 630). Otherwise, it erases the cursor, then the portion of the screen located after the first empty spot. It CALL GETs the row and column of that spot (T1 now holds the position of the first asterisk in HD\$) and also GETs the row of the last card in the hand (last character in HD\$, row put into T2; X is here a dummy for column value, of no use here). Tex can now erase the squares at the right of the first empty spot for a length of K=22-C, then the remaining rows of cards, from the top screen row of the next full row of cards (R+4) to two screen rows below the top row of the last card (T2+2). R1 and C1 now take the value of the cursor position above the first empty card, in preparation for the screen redrawing. S will temporarily hold the starting position for the next routine, which will remove the asterisk flags from HD\$ (lines 670-680). When that is done, we have our new hand, to which we add cards from the deck to make a total of 25. The deck flag PD is incremented accordingly. If the deck is empty, i.e. if its flag is beyond 52, no cards are added. In both cases, Tex goes back to redraw the screen from the first empty spot, i.e. from where it started to erase it. T1 still holds the position of that first empty spot in HD\$, now position of first card to put back on screen.

If we E)nd the session, Tex clears th. screen and colors it pale blue, then it resets the uppercase characters and the digits to their normal self with CALL CHARSET. It then prints the results of all the games we have played, i.e. how many cards were successfully removed from the deck. The printing pauses after each group of 20game results.

Here are some notes on the user-defined subs: In GET, row R and column C are derived from position X in HD\$. The screen displays the cards in five rows and five columns, hence the formulas. Since each row of cards takes four screen rows, C and R are eventually multiplied by four. ER erases both flag and square with four spaces on each row. FLAG is the opposite formula of GET — we have the row and column of the two cards in the pair (R1,C1 and R2,C2 passed as parameters), from which the sub finds the P position of the corresponding character in HD\$, which it replaces by an asterisk. The other subs are easy to understand.

We press "F" to give up, which happens when there are no more pairs to be found. The check in line 410 brings us to line 730 (we don't win, so Tex skips line 720). The array GP keeps the number of cards removed from the deck, which is twice the final number of gold coins/pairs in OK\$. It then displays a choice: N)ew or E)nd. Pressing "N" for a new game goes back to the shuffling routine in line 300, after erasing the screen from rows 1 to 20.

By BRUCE HARRISON

Seems we're forever thanking people in this column, and this month we're going to put the thanks right up front. Thanks to John C. Johnson of Cedar Rapids, Iowa. John is a regular reader of our column, and a very skilled programmer. He read our complaint about not being able to get Bit Map mode to work, and supplied some immediate help. His help was in the best possible form, as source code files on disk. These files included a correct way of setting up the Bit Map mode and a plotting subroutine so that we can turn on any selected pixel on the screen. FANTAS-TIC! This was just exactly what we were hoping to be able to do! Today's column will be the first of two parts devoted to Bit-Map mode.

AN OLD STORY

John's package to us included a very old article from the IUG magazine, in which Bill Gronos explained the operation of Bit Map mode, and supplied the subroutines that John incorporated into his own "sample" programs. Long-time readers of this column will remember that way back, near the beginning of this series, we gave you a series of subroutines that could be used in Graphics Mode to do things like put strings on the screen and such. This month, we will do much the same for the Bit-Map (See Page 11)

mode. The column itself will be fairly short, as the sidebar is a complete program that does some things to illustrate the use of the subroutines. This program, among other things, goes back and forth between the Graphics and Bit Map modes to show that this can be done smoothly. We've also used some slick moves at the beginning of the program to capture the character definitions and color tables that were in use while we're in graphics mode. The character definitions are then used while we're in Bit Map mode to print legends on the screen.

This month's sidebar is a complete program, organized into three parts. The main program is called BITEXP/S. This is supported by subroutines in BITSUBS and by a data section called BITDATA. The main file uses the others with copy directives. The heart of all this is the BITSUBS file, where we've supplied subroutines to get you gracefully into and out of Bit Map mode, to plot lines or curves pixel-by-pixel, and to put text strings or just single ASCII characters on screen. The coordinate system for the single-pixel plotting is similar to the Dot-Row and Dot-Column system you'd use for placing sprites. For characters or text, the Row and Column are used just like for Graphics Mode. In both cases, the subroutine will accept a color instruction placed in R9 before the BL. If R9 is clear, no change will be made to whatever solor that part of the screen is already set up for. For characters or Grings, R9 specifies in its left byte the foreground and background colors. For single pixel plotting, the left nybble of R9 specifies the foreground color for that pixel, with the background remaining whatever it was for that part of the screen.

THE PROGRAM

It doesn't do a whole lot, but here's what: It puts a menu onscreen in Graphics Mode, with four choices offered. Any keystroke outside the 1-4 range will be ignored. Selecting 1 through 3 will cause a switchover to the Bit Map mode, which will set up as black-on-white colors. For BOXES, a series of single-pixel boxes will appear, each one inside the previous one, until there's room for no more. All these boxes are made blue on white, since **R9** was set to >4000 before we started drawing. Then a legend "BOXES" is written as a string in white on blue at the bottom of the screen. Once that's done, the computer just waits for a keypress, then returns to the Graphics Mode and displays the menu. The graphics mode colors and characters are put back where they belong in VDP Ram as part of the SETGM routine.

Selection 2 makes a Bit Map rectangular spiral on the screen, changing colors for each leg of each time around the screen. The vertical lines are all black, lines on the bottom are red, while lines across the top are blue. The word SPIRAL gets displayed at the bottom of the screen in white on dark green. Pressing a key returns to the menu. Selection 3 uses those many data entries in BITDATA to draw sine curve on the screen. The X-axis is labeled at 0, 90, 180, 270, and 360 degree spots, then "A SINE WAVE" appears twice — near the bottom of the screen in black on white, then again near the top in white on dark green. This is done just to illustrate (See Page 12)

THE ART OF ASSEMBLY—

(Continued from Page 11)

an important difference between the normal Graphics mode and the Bit Map mode. The same characters can be set into different colors on the same screen, provided only that the characters are written in a different place.

Selection 4 exits gracefully back to Editor/Assembler, but will also exit gracefully to Funnelweb if that's how it was loaded. The EXIT routine replaces six bytes at the location pointed to by >8370 so that DSR routines will work upon return to E/A or Funnelweb. We stashed away those six bytes as part of our opening section, so that on return to E/A, everything in E/A would work can be used by itself as a "clear screen" while you're in the Bit Map mode. We also use that subroutine to clear things before our transition back to graphics mode, again to minimize any cosmetic problems in that transition.

The PLOT subroutine was copied as is from what Johnson sent, but we added the ability to color the pixel just written. The CHAR feature was added to show that it could be done. Inventive readers will find this works for any characters, even those taken from revised character sets, CHARA1 files, and such. Now that we have cracked the door open, we'll try to pass along some more techniques and tips for bit map operations in future columns. As we write this, we're working on a little "toy" program to draw pictures and such. The TI world doesn't need any more such programs, but we learn a lot more by writing them than by using the existing programs, and learning is what this column is all about. Because this month's sidebar is so large, we're going to save the explanation of how all this works for next month. Keep this one handy, so next time you'll be able to study how all this little "example" program works.

correctly.

THE SUBROUTINES

First in the subroutines is SETBM. This is the means of getting from Graphics mode into Bit Map. We re-arranged the order of performing these steps from the original, so that the transition to bit map is made at the very end, after all the conditions have been set. This makes the transition appear "seamless," so no glitches appear during the changeover. We also took the part that clears out the character definition table into a separate subroutine so that it

VRAM analyzer lets user determine

GENEVE

VRAM memory address

By JIM UZZELL ©1994 DDI SOFTWARE

In order to do any serious programming on the Geneve that involves the 9938 video chip, you must have a copy of the V9938 manual, which is available from 9640 News.

Readers who have the manual know that it is not written in a manner that is easy to understand, so I wrote the VRAM Analyzer to allow me to quickly ascerta the VRAM memory address based on mode and display page. This program uses a XOP6 routine to (See Page 15)

MICROpendium/December 1994 Page 15

VRAM ANALYZER—

(Continued from Page 14) capture the table of addresses built into MDOS. I believe these tables do not accurately reflect the VRAM memory locations based on the display page of the mode selected, but you can be the judge of that.

Regardless of mode, each page starts with page 0 through one less than what is displayed on the screen for that mode.

All files must be on drive 1, unless you

Static electricity

Low temperatures and humidity increase problems for computer users

By DENNIS HATHAWAY

The following article appeared in HUGgers, the newsletter of the Hoosier Users Group.—Ed.

Fall is here, winter is just around the corner.

With winter comes low temperatures and extremely low relative humidity (RH). Low RH presents us with the problem of dealing with very high levels of static electricity. So it is timely for a discussion of static.

What is static? What can it do to our hardware? What precautions can we take to reduce problems? First, what is it? Every person, animal and machine carries with them an electrostatic charge (Q), except when in direct contact with a conductive path to ground. We accumulate this charge as we move around. For example, walking on a carpet, touching things or others that carry a charge greater than ours, rubbing together of items of clothing, especially clothing of man-made materials, even the friction of air flowing past us.

Depending on the materials involved, we can become charged either positively or negatively with respect to ground. When we touch something with a different level of charge, we often feel a sharp tingle or minute burn. Oddly, we don't often feel anything if the potential is less than 2300 volts, because then the total static power involved is small. This sensation is caused by the discharge of the static we were carcause women's shoes often have thin soles, their capacity (C) is often higher than that of a man. Typically, Q ranges up to five microcoulombs.

A calculation will show that a person whose Q equals three microcoulombs and whose C equals 200 picofarads will be at 15 KV with respect to ground, where one kilovolt equals 1000 volts.

In extreme cases, this voltage can be as high as 40 KV. Beyond this point, the charge will bleed off through the air and sometimes may form a corona. The drier the air, the less the bleed-off. This is why we should be concerned when the relative humidity is low. In upper Wisconsin, during the fall sev eral years ago, I measured 23 KV on a main walking toward me over a vinyl-tiled floor. He was wearing shoes with crepe soles. The measurements were made with (See Page 17)

rying, its Electro Static Discharge (ESD). More on ESD later.

The charge we carry (Q) is given by Q=CV, where Q is in coulombs, C is in microfarads and V is in volts. For a human being, C is usually around 100 to 250 picofarads, depending mainly on overall bulk, size of feet and type of footwear. Be-

STATIC ELECTRICITY-

(Continued from Page 16)

a grounded electrostatic meter. At the same location, the plastic cover on a notice board was at 45 KV. Even allowing for meter inaccuracy, this still gives an indication of the level of voltages out there during the winter months. We must not let this cause us to think that we generate static only when the relative humidity is low. This is not the case. We generate static all year long, but when the relative humidity is high, the charge bleeds away more readily. I am sure that all of us have at some time touched the screen of our monitor/TV while working at the keyboard and have heard the air crackling as we became charged by some 12 to 15 KV. When we next touched the Leyboard, we partially discharged into the console. Texas Instruments was fully aware of this problem when it designed the 99/4A and almost certainly took suitable precautions to prevent damage to the console when it is >zapped in this way.

tance, usually around 1000 ohms. The effect is that we can be feeding some 20 amps into the equipment for some 100 nanoseconds. Doing this to the connector contacts on a module or a Peripheral Expansion Box cards will damage to them. In some cases, the damage will be obvious

When we discharge into our equipment, it takes place very rapidly, depending on our capacitance (C), and our skin resistance, usually around 1000 ohms. The effect is that we can be

terminal we should bear in mind that every item around us has some capacity to ground, so by touching them briefly we share our charge with them. Do this to a couple of items (preferably large metallic ones) like a chair or filing cabinet, etc. Personally I use an exposed screw head on my grounded power distribution expansion strip which sits on top of my PE box. If we are working on a printed circuit (PC) board outside of our PEB, or of our printer, then a more elaborate method is needed. Consider, while sitting at the bench/table we may raise our potential by as much as 1,000 volts each time we reach out to pick up a tool or device. An aid known as a wrist strap will help here. A conductive band goes on the wrist, and is connected via a 1.5 Megohm resistor to ground. This continually bleeds away any static as fast as we generate it. The resistor limits current if we accidentally touch something with mains potential on it. These wrist straps are available from most electronic parts vendors for only a few dollars.

But what can happen to our equipment if we pass our charge to it in a manner TI did not anticipate?

Actually, we share our charge with the equipment until both ourselves and it are at an equal potential, then current flow ceases. In practice, a typical discharge is found to be somewhere on the order of 20 millijoules. A joule equals one watt per second. feeding some 20 amps into the equipment for some 100 nanoseconds.

because the system will quit operating. However, usually we end up with a device that is only partially damaged. I refer to these devices as "walking wounded." The device continues to work but it is likely to die at any time, perhaps weeks later after we've completely forgotten that we'd zapped it with 20 millijoules. It is general knowledge that MOS (Metal Oxide Semiconductor) devices used in many TI assemblies are susceptible to this kind of harsh treatment. However, bipolar transistors, diodes and other devices are also affected in a similar way, but to a somewhat lesser degree.

While the above discussion is directed to work on the 99/4A, it applies equally to other electronic items — radio, TV, VCR, etc. Static can ruin most electronic equipment. It would be well to ensure that one's spouse and children are made aware of this static problem, so they will not nullify our efforts to prevent damage to our equipment.

When we discharge into our equipment, it takes place very rapidly, depending on our capacitance (C), and our skin resis-

How do we prevent static damage to our 99/4A? As we are about to sit down at our

CC40

TI gave up too soon on this great little computer

By CHARLES GOOD ripherals. Some of these are rare collector's into an external power source, a CC40 sys-The CC40 (which stands for "Compact" items. The article also lists current sources tem allows truly portable computing and Computer 40") was in early 1983 TI's first of supply where you can purchase the printing anywhere. This little orphan is of ever entry into the portable computer mar-CC40, its software, and important peripherinterest to owners of 99/4A computers for ket. It is in many respects a little brother to als. two reasons: The 99/4A, so much so that Funnelweb's se-The CC40 computer is battery powered, 1. The syntax of its built-in CC40 BAnior author Tony McGovern calls the CC40 very small, (smaller than most modern lap-SIC language is almost identical to the "Little Tex." This article, based on my own tops), and it was offered with a host of 99/4A's Extended BASIC. experience using the CC40 system, desmall peripherals, most of which are also 2. TI intended the 99/2, the 99/8, the scribes the CC40 computer and its tiny pebattery powered. Without the need to plug (See Page 18)

CC40-

(Continued from Page 17) 99/4A, the CC40, and all of its tiny peripherals to be physically cabled to each other and to talk to each other using a proprietary bus connector called a "HexBus" that is found on all these machines except the 99/4A. To make HexBus devices work with the 99/4A, TI intended to sell a "HexBus interface," a peripheral that had a HexBus connector and that attached to the right side of a 99/4A console. The HexBus interface is pictured on the boxes that contained beige 99/4A consoles but it was never officially released. I own a HexBus interface and use it regularly as part of the 99/4A system on a little table next to my bed. The interface, when combined with tiny HexBus peripherals, permits an expanded 99/4A system to occupy very little surface area. Although the CC40 is no longer manufactured by TI, the computer, cartridgebased software, and some of its tiny peripherals are still available from dealers such as those listed at the end of this article.

2.5MHz TMS70C20 8-bit processor and has 34K of ROM and 6K (expandable to 18K internally) CMOS RAM. There is a "solid state cartridge" port, and the internal RAM can be further expanded with 8K or 16K memory expansion cartridges. Software cartridges, such as the Memo Processor word processing cartridge, can also be inserted into the cartridge port. The ROM includes a very powerful and familiar-looking BASIC. Both upper- and true lowercase letters (not just small uppercase letters) are provided. Error and system messages can be displayed in either English or German.

method of laptop data entry while holding the CC40 steady with your other hand. It is not necessary to press two keys at once. For those features, such as one-time capital letters that require the use of the Space, FN (function), or CTL (control) keys, either press both keys at once or press the special key first and see an indicator on the LCD display turn on. You then press the second key — for instance Shift and then D to display an uppercase "D," or FN and then tilde () for insert — and the special LCD display indicator turns off. A separate numeric keypad is to the right of the qwerty alphanumeric keys. The number keys on the top row of the qwerty layout are duplicated in this keypad. Special keys are included for cursor movement (four dedicated keys), Break, Run, On, Off, and reset.

When it was introduced, the CC40 had a list price of \$250. Sales were not good in 1983 and 1984 because no mass storage device was made available by TI. The promised cheap Wafertape Digital Tape Drive turned out to be exactly that, cheap. It was unreliable and thus never released, and at that time TI had no other inexpensive CC40-compatible mass storage device to offer the public. In 1984, production of this fantastic little computer ceased. In May 1990 I paid \$95 for my new CC40. New CC40s are available now for \$49 from Jim Lesher, and used computers are available from several of the dealers listed below. For an extra \$20-\$25 you can purchase an expanded memory CC40 or have dealer installation (by L.L. Conner Enterprise) of the necessary chips to bring the CC40's internal RAM to the maximum 18K, up from the 6K RAM found in the typical CC40. Conner will also sell you the RAM chips if you want to do the job yourself. This extra memory increases the CC40's internal buffer capacity to around five double-spaced pages of word processing text. The CC40 measures about 9x6x1 inches, the size of a small textbook. It uses a

I have no idea what the "40" in CC40

A very important feature of the CC40 is that any BASIC

program or any word

processing document entered

into the CC40's RAM stays

there even after the computer

is turned off.

200 HOUR BATTERIES

A very important feature of the CC40 is that any BASIC program or any word processing document entered into the CC40's RAM stays there even after the computer is turned off. Four alkaline AA cells are said to provide enough power for 200 hours of operation. My experience shows that these batteries will last many months of "computer off" time. Compare this to the 2-4 hours most "modern" laptops will run using their batteries. The CC40 and all its small battery powered peripherals can also be powered with an AC adapter. The BASIC that comes as standard equipment on the CC40 closely resembles TI Extended BASIC, but lacks most of the 99/4A's graphic, color, and sound features. There are no sprites and only one kind of programmable Beep. Multi-line statements up to 80 characters in length are supported, as are user defined subprograms with variables independent of the main program. Seven (ASCII 0-6), can be user defined with CALL CHAR on a 5x8 pixel grid. CALLs relating to assembly code include POKE, LOAD (an assembly subprogram from an external device), PEEK, and EXEC (starts an assembly language program). Two dimensional arrays are supported. Typing BASIC code into the CC40 is made easy with automatic line numbers (NUM) as in Extended BASIC. Delete (See Page 19)

refers to, certainly not the CC40's display. The LCD display shows 31 characters of a single 80-character line. You need to move the display left/right to view the entire line. Four dedicated cursor keys allow you to scroll up/down to view other lines or left/right within a line of text or program code. The LCD display includes special indicators for such things as low-battery, the status of the shift function and control keys, uppercase lock, and special math functions. Some LCD display indicators are user programmable. A control on the left side of the CC40 regulates the contrast (intensity) of the LCD display. The CC40's keyboard consists of chiclet keys. Alpha numeric keys are arranged in a 44-key qwerty typewriter layout, with number keys on the top row. It looks similar to the 99/4A keyboard arrangement. No, you can't easily touchtype. The alpha keys are just too close together. One finger pecking is the usual

CC40----

(Continued from Page 18) will delete one line number or a specified group of line numbers from the middle of a BASIC program. You can type the words for BASIC functions and commands with the alpha keys one letter at a time. However, many BASIC commands and functions can also be displayed on screen by pressing only one or two keys. A plastic keyboard overlay that comes with the CC40 shows these special keypresses, most of which involve pressing the CTL or FN key followed by another key. A particularly powerful feature you can access from command mode or from a running BASIC program is CALL DE-BUG, which brings up a built-in assembly language monitor and memory manager. This is designed to be used with the CC40's Editor Assembler Module (never officially released), but can also be used by itself. When in the DEBUG monitor you can display, modify, or copy any memory in hex. You can also change the microprocesso's program counter, stack Sointer, and status register. You can set break points, single step through assembly code, start execution at a given address, and control paging in and out of system ROM and cartridge ROM. DEBUG is

than 80 characters, you can enter part of the chain and press Enter for an intermediate answer. Then, starting with the intermediate answer, enter the rest of the numbers of the chain and press Enter to get the complete mathematical answer to the entire chain calculation.

You can also use the CC40 as a scientif-

For an investment of \$125 (\$50 for the CC40 and \$75 gram, which does not require a cartridge and which is more stable in the CC40's memory. Send me a self-addressed stamped envelope and I will send you a hard copy of this program.

2. The HexBus RS232; about \$30-50 used. This is a very important peripheral. You can use it to print to a regular parallel printer from the CC40 or to send word processing text or other data to another computer. To send word processing text from a CC40 to a 99/4A use a HexBus cable to connect the CC40 to a HexBus RS232 peripheral and run a serial cable from it to the RS232 port of your 99/4A. You can then send text directly into TI-Writer or the Funnelweb editor without using a terminal emulator program or null modem on the 99/4A. Here's how. From TI-Writer type "LF" (load file) and specify "RS232.CR" as the file name. Then, using either Memo Processor or my own CC40 BASIC word processing program, tell the CC40 to SEND its text. Text will flow out of the CC40 and into the TI-Writer edit buffer. When the computer lights stop flashing press FCTN/4 on the 99/4A and your text originally entered into the CC40 will be displayed on the 99/4A's monitor ready for further editing and saving to a TI disk. The HexBus RS232 is the only HexBus peripheral that is not battery powered. It needs an AC adapter. 3. The HexBus Printer 80; around \$100 new or used. This small (about 13x6x2 inches) 80column thermal dot-matrix printer is powered by 4"D" batteries or an AC adapter. It uses small ribbon cartidges to print on ordinary 8.5 x 11inch typing paper, or you can print on rolls of 8.5-inch wide fax paper without the ribbon cartridge. Thus, for an investment of \$125 (\$50) for the CC40 and \$75 for the Printer 80), you can have a totally portable, battery powered word processing system. For an extra \$70 (\$50 for the HexBus RS232 and \$20 for Memo Processor) you can have everything you need for a complete word processing package. I am composing this article on my CC40. This paragraph is being written while sitting on a bench in the quadrangle of the O.S.U. Lima Campus enjoying the sun. Other paragraphs will be written later (See Page 20)

for the Printer 80), you can have a totally portable, battery powered word processing system

ic calculator by typing in your calculations directly, rather than writing a BASIC program to do the calculations. Calculation accuracy is 13 significant figures, with 10 significant figures usually showing on the CC40's display. Scientific notation is supported, allowing the CC40 to deal with numbers as small as +/-1E-128 or as large as +/-9.999999999999999999E+127. PI, SQR, any other power or root, log (base 10, and base E), sine, cosine, tangent, arcsine, arccosine, and arctangent are all supported with special keypresses. Angles are calculated in either degrees, radians, or grads. A special indicator on the LCD display (DEG, RAD, or GRAD) shows which kind of angle is in effect. RAD is the powerup default. You could easily spend \$30 for a hand-held scientific calculator, and you would still not have a 31-column display or a scrolling 80-column data field. For a few more dollars you can have a CC40, which is a real programmable computer as well and not just a calculator. **WORD PROCESSING** For me the most practical use of the CC40 is as a portable word processor. When used as a word processing system, the following CC40 hex bus peripherals are important: 1. Memo Processor, a CC40 software cartridge; \$20 new with an extensive instruction book. Actually I prefer to use my own BASIC CC40 word processing pro-

very powerful, and it is built into the CC40 for use whenever needed.

User defined hot keys can be set up, and remain in battery backed memory even after the CC40 is turned off. FN + 1-9 are the potential hot keys. These can, for example, be set up for commonly entered BA-SIC code, number sequences used in math calculations, or short text memos such as names and addresses.

No little calculator can do a better job than the CC40 for the display of chain number calculations. I routinely use the CC40 to balance my checkbook and to calculate student grades from a series of numerical student exam scores. You can type in up to 80 characters of mathematical numbers and symbols (such as 112.56+56.35-45-54.95+12) and then scroll left/right to make sure that all your numbers are correctly entered before pressing Enter to display the answer. Pressing "play back" will redisplay the numbers of the chain calculation that gave you that answer. If your chain is greater

CC40---

(Continued from Page 19) today sitting on my fromt porch at home and laying in my bed watching the evening news on TV. Then I will dump the text, via my HexBus RS232, to the Funnelweb (TI-Writer) editor on my 99/4A and save it from there to a 99/4A disk that I will send to MICROpendium. This is truly portable word processing! A CC40 system is absolutely the cheapest word processing system it is possible to purchase anywhere. Compare these prices to the cheapest laptop computer advertised in Computer Shopper or a non-battery powered dedicated word processor/printers with little flip up screens (Brother, Smith/Corona, and similar brands) sold in retail stores and in discount catalogs. Price-wise there is no comparison.

direct connect modem with rear connectors for two HexBus cables and two RJ11 phone cables. I am told that electronically it has properties that are identical to the 99/4A's acoustic "telephone coupler" modem. It works well, but today would probably be considered little more than a toy. It has been a long time since computer data crawled along phone lines at a speed of only 300 baud. Many information services and BBS systems do not support such a

BASIC program in each cartridge. Program storage only works if you have a 6K CC40. If you are using an enhanced 18K CC40, the 8K cartridge can only be used for memory expansion.

Combined use of the battery backed cartridge for program loading and the nonbattery backed 16K cartridge for RAM expansion works very well with my BASIC word processing program. 16K cartridges are still commonly available for about \$30-40 from dealers. First I plug in an 8K cartridge that contains my word processing program and transfer that program to to the RAM of my 6K CC40. I then unplug the 8K cartridge and plug in the 16K RAM expansion cartridge. Executing a CALL ADDMEM adds the 16K to the 6K already in the CC40, giving me 22K of RAM to store text (6-7 double-spaced pages) using my word processing program. You can't do this using the Memo Processor cartridge, which must remain inserted in the CC40 while in use. This is one of the reasons I prefer my BASIC word processing program. • TI's PC Interface --- \$60 new, sold directly by TI. This small peripheral, known as the PCIF, plugs into a PC parallel or LPT port and allows BASIC programs and data files in a CC40 to be stored on or loaded from a floppy disk or the hard drive of an IBM-compatible computer. The IBM computer then becomes your mass storage. Sounds great doesn't it! Unfortunately, it is a bit tricky to hook the PCIF to the CC40. The PCIF was made for use with the TI74, which is a more modern and somewhat smaller version of the CC40. Although the PCIF is electrically compatible with the HexBus, the 10-pin holes arranged in one straight line on the PCIF's female connector will not directly plug into a HexBus or a HexBus cable. The HexBus has eight pins arranged in two rows of four. I cut common paper clips to make short wires that stick snugly into the holes in the end of a female HexBus cable and the corresponding holes in the female connector of the PCIF, filling eight of the 10 PCIF connector holes. The remainin two PCIF connector holes are for power, six volts in and out. The CC40 has no way of delivering this needed power to the (See Page 21)

OTHER PERIPHERALS

In addition to the peripherals described above, the following two HexBus peripherals are sometimes still available new or used from dealers. All HexBus peripherals should be purchased with a HexBus cable. Make sure you get one with each peripheral you purchase. You daisy chain the needed peripherals together with such cables and connect the first peripheral in the chain to the CC40. Most HexBus peripherals measure about 6x4.5x1.5 inches and are designed to neatly stack on top of each other. • Hexbus Printer Plotter — This cute little printer prints on adding machine paper. There are four little ballpoint pens, each a different color. Replacement pens can still be purchased at Radio Shack stores. You can program the X-Y axis movement of each pen as you print multicolored graphs and drawings. Several different text sizes from teeny-tiny to about one inch tall are available. Text can be printed in any direction — vertically facing either left or right, horizontally, and even upside down. Although this printer does have some unique features, it is not really useful in printing documents. Also, it has some reliability problems. There is an internal plastic gear that has a history of breaking (Cecure has a metal replacement gear), and its alkaline battery is soldered in and cannot easily be replaced. If the battery fails to hold a charge you are out of luck even if you use the optional AC adapter. • Hexbus Modem — This is a 300 baud

slow speed any more.

AVAILABLE SOFTWARE:

The following official TI software cartridges for the CC40 are available new for \$20 each from Cecure Electronics and sometimes less from other dealers listed below. Each cartridge comes with a wellwritten user guide. They include: Learn Pascal, Memo Processor, Finance, Elementary Engineering, Statistics, Math and Games.

I have about 20 BASIC programs which I will be glad to send you either as hard copy listings or on a "quick disk." Some of these programs take advantage of the special features of various HexBus peripherals. Either send me a quick disk (see below) and a paid return mailer or send me \$2 for the hardcopy listings. Your cash pays for return postage and my copying costs. THE MASS STORAGE PROBLEM Lack of mass storage options is why the CC40 failed commercially in 1984/85, and this is still a big problem for CC40 owners today. Since I use the CC40 mostly for word processing, I can usually get along without mass storage. Text I enter into my BASIC word processing program for the CC40 or into Memo Processor is conserved for weeks or months in the battery backed RAM of the computer until I can dump the text to my 99/4A system via the HexBus RS232. The following mass storage options are possible:

• 8K Memory Expansion — About \$30 used. Functionally this resembles the 99/4A's Mini-Memory cartridge. The 8K CC40 cartridge is battery backed and can be used either for program storage or as memory expansion, but not both. These 8K battery backed cartridges are not very common anymore, but some are still available from dealers listed below. You can purchase a bunch of these and store one

MICROpendium/December 1994 Page 21

<u>CC40</u>

(Continued from Page 20) PCIF. You have to modify a Radio Shack black cube AC-to-6vDC power adapter so you can plug the adapter into the last two pins of the PCIF. Connecting my CC40 and power adapter as described here to the the PCIF allows me to store CC40 software on PC disks.

• Mechatronic QuickDisk peripheral — This small disk drive is the only HexBus peripheral I have ever heard of that is not made by TI. It was made by a German company specifically for the CC40. I find it to be very fast, reliable, and easy to use for data file and program mass storage. The peripheral is fairly small (7x5.5x3) inches), not battery powered, and uses 2.8inch disks (not the common 3.5-inch disk size) to store up to 64K on each side of a flippy disk. In 1990 I paid \$110 for a new QuickDisk drive. The drive is now out of production and there apparently are no new QuickDisk drives gathering dust on dealer's shelves. If you can find a used, working QuickDisk drive then buy it! ^WUsed QuickDisk drives are hard to find. • Wafertape Digital Tape Drive --- This was going to be TI's cheap, portable mass storage device. It ran on batteries or an AC adapter and used a small continuous-loop tape cartridge. Although data was stored serially, it had many of the characteristics of a random access device. For example, programs and data files can be loaded by file name from a wafertape that contains several different files. I own one of these rare devices (serial number 0000007) and several official TI wafer cartridges that have a TI logo on the label. My wafertape drive is not very reliable. Many times I

have saved and verified data files or BA-SIC programs to wafertape only to find that later I can't load this information back into my CC40. Reliability problems are probably why TI never released this peripheral to the public.

• Hexbus Floppy Disk Drive Controller — This also was never released by TI, probably because the CC40 and its peripherals were marketed as an inexpensive alternative to other 1983 computer systems, and the HexBus floppy drive was not inexpensive. This is the rarest and probably the most useful of the HexBus peripherals. The controller worked with IBM-compatible 360K drives and 5.25-inch disks, formatting DSDD at 16 256K sectors per track just like TI's never released DSDD disk controller for the 99/4A. I know of four working HexBus floppy controllers in the whole world. Its too bad one of them isn't mine, yet!

HexBus peripherals, and rare documentation. Write or call for a current product list. He is the only source I know of for 8K battery backed RAM cartridges. Jim also sells software cartridges and 16K expansion RAM cartridges and has the two books mentioned above.

• L.L. Conner Enterprise, 1521 Ferry St. Lafayette IN 4790; phone 317-742-8146, fax 317-423-4879. A source of used and occasionally new CC40 computers, HexBus peripherals, and cartridge software. Phone almost anytime for a list of what is currently in stock. Larry Conner will upgrade CC40s from 6K to 18K of internal RAM or sell you the chips to do it yourself. He will also make the serial cable to hook a HexBus RS232 to the 99/4A RS232. • Texas Instrument; phone 800-TI-CARES and have your credit card ready to order the PCIF, which is considered by TI-CARES representatives to be a TI74 or TI95 product. TI is the only source I know for this peripheral. It is part number 1065751-0001 and costs \$60, plus shipping and state sales tax. TI also sells an AC adapter you can use instead of batteries to power the CC40 and some of its peripherals. This is called the AC9201, part number 1055601-8900, and costs \$18.95. TI now refers all inquiries about sales and repair of CC40 products and HexBus peripherals to Cecure Electronics. • Charles Good, P.O. Box 647, Venedocia OH 55894; phone 419-667-3131. That's me, the author of this article. I will send you what I have in the way of CC40 BASIC software as described earlier in the article.

SOURCES OF SUPPLY

• Cecure Electronics. P.O. Box 222, Muskego WI 53150; phone 800-959-9640. This is the official TI service and exchange center for the CC40 and its peripherals. They don't sell the computer or peripherals but they do repair them on a flat fee exchange basis. They sell the following CC40 cartridges new: 16K expansion RAM (\$40), Memo Processor and other software cartridges listed above (\$20 each). They also have new "user guides" for those who have the computer but no book and a "Learn Basic" book published by McGraw Hill specifically for the CC40. • Jim Lesher, 722 Huntley, Dallas TX 75214; phone 214-821-9274. A nice selection of used CC40s (\$50 for a 6K CC40),

10th European meet slated for Austria

The TI- and Geneve User Group Vienna is organizing the 10th International TI- and Geneve User Meeting in Vienna Sept. 22-24.

This is the first meeting of this kind to be held in Austria. Site of the event is the Wohlfahrtsgebäude der Wiener E-Werke (Welfare Building of the Vienna Electricity Board), Wachaustr. 28, A-1020 Vienna.

An entrance fee of ATS 100 will be charged. Overnight lodging including breakfast is available at the site. Accommodations with two are three beds are available for ATS 250 per person. As only 27 beds are available, attendees are advised to make reservations early. Kurt Radowisch, facilitator for the event, says he can send exact descriptions of the arrival route and maps locating the event to anyone needing them. He also says he would appreciate a short note from TI and Geneve users, even those unable to attend.

Correction to The Art of Assembly

The following source code was left out of the Sidebar 41 from November's Art of Assembly column titled "It's about" time." These lines precede the lines that started on page 9. The entire listing was intact on the November MICROpendium disk.

Tone dialing through a decadic service Doing it the TI way

By GEOFF WARNER

Warner belongs to the TI Users of Perth (Australia) user group. We found the article in the TIsHUG News Digest.—Ed.

I had occasion to access a remote computer system from my home recently and started to think of ways to enable me to go the "TI way" rather than use the PC laptop that I cart about with me for employmentrelated purposes — and the odd demonstration at TIUP meetings. The problem was the remoteness of the system and my unwillingness to go through the hassle of making the call at great personal expense and then recouping the cost through the "system." I have been issued a Telecon Telecard for occasions such as these, but I don't have tone dialing connected at my house. I was tired of the impersonal interface with a faceless voice after what seems to be an inordinately ag wait for an operator. I hated holding a tone commander" up to the telephone handset and entering the appropriate codes that way. I wanted to automate everything. But above all, I wanted to prove that it

mentioned laptop in my setup procedure. What I would do is assign a macro for the access code to the Telecard system and a semicolon at the end of the string to prevent the modem from going online when

service.

Listen for the response in your modem's speaker.

When prompted for your Telecard number and PIN number, execute the macro to tone dial your Telecard and PIN numbers. Listen for the response from the modem.

the call is answered by the remote Telecard computer.

Then I'd assign a macro for the Telecard number and PIN number — and here is the secret to it all — prefix the string with "ATDT," the command that tells the modem to tone dial the numbers that follow. We must also not forget to finish with another semicolon. Now assign a macro for each of the numbers you wish to dial, not forgetting the preceding ATDT and the trailing number sign to tell the Telecard computer system to get on with it. In order to operate in this way, you must first have a Hayes-compatible modem with a built-in speaker and a terminal program that supports macros. All of my tests so far have been with Telco. Of course, you can enter each of the strings that I have assigned to macros individually while in command mode, but we have computers to make our lives easier, not harder. Besides, sometimes you may type too slowly for the system and end up with

When prompted for the number you wish to call, execute the macro for the number of the service you wish to connect to.

Log on and enjoy your session.

Obviously, there are other uses for this method, and one that immediately springs to mind is the use of your computer to autodial numbers for you, and then enter PINs and account numbers and the like. The possibilities are limitless, and you can use your TI to achieve what your mates with more expensive computers can do at a fraction of the cost.

could be done on the TI! **EXPLANATION FOR OUR FRIENDS** IN THE USA

The Australian Telecard system requires you to dial an access code to get into the system, whereupon you wait for instructions, voice prompts to use the correct jargon. You then dial your Telecard number, followed by your Personal Identification Number (PIN) and wait further instructions. Then you dial the number you wish to reach, preceded by the area code and followed by a "#" to indicate to the system that you are ready to connect.

This is all very well, if you are connected to tone dialing. Unfortunately, it doesn't work very well if you use decadic, or pulse, dialing at your abode or place of work. If this is the case, you need to wait and talk to an operator after dialing the Ast four-digit access code. The answer eventually came to me while reading through the documentation for Telco — I could use the macro facility of Telco to access the Hayes-compatible modem that comes as a set with the afore-

Rare - Myarc Hard & Floppy Controller with 10 Meg Hard Disk & Case \$350

800-471-1600

the network operator trying to have a conversation with your modem. I know that I

have. Here is the operating procedure:

Load Telco or your preferred telecommunications program.

Enter terminal mode.

Execute the macro to dial the Telecard

NEUSBYTES

Categorized TIPS files available on disk

More than 6,000 TIPS images are available on a 52-disk set complete with index.

Raymond Frantz of Phoenix, Arizona, says he spent six weeks separating and recording the images onto disk with use of Patrick Powell's TIPS Manipulator. He says the disks include all images known to him, after checking with Earl Raguse, who added some images. Disks are categorized according to topic. Images of cats and dogs, for instance, support two disks, while religious images are together on a single disk. Duplicates have been eliminated and images have been renamed to conform to a system. Files are numbered consecutively so that users have a numbered filing system they can use.

single or doublesided format, for \$49.95 including shipping. He suggests that each users group get its own set and allow its membership to copy it for a slight fee. Checks should be made out to Raymond Frantz, 502 N. 51st. St. #2, Phoenix, AZ

85008.

CD-ROM project fizzles

Fred Moore of the LA Computer Group has announced that his effort to put all TI99/4A program from all users groups on a CD-ROM has ended.

"I could not get the other users groups to send me their disks although I would do all of the work and return back their

Frantz offers the entire 52-disk set (with index and four-column printer) in either

disks," he states.

However, he notes that in the procedure he has archived the complete LA99 library on about 100 DSDD disks, approximately 1,000 DSSD disks of programs. Price for the complete set is \$50, including tax and shipping, payable by check to Fred Moore, 7730 Emerson Ave., Los Angeles, CA 90045-1117; phone is (310) 670-4293.

Send information about your products and services to MICROpendium Newsbytes, P.O. Box 1343, Rour Rock, TX 78680.

Relief from eyestrain is just a blink away

Want to contact MICROpendium by phone? Call us Saturday mornings, from 9 a.m. to noon, Central Standard

While computers save users time and money by performing an amazing array of functions, they can also cause eyestrain and other similar problems.

Persons who spend long stretches at a computer may suffer from headaches, fatigue and serious eyestrain. If your eyes feel irritated or itchy at the end of the work day, or you suffer occasional headaches, your computer could be the likely culprit. The computer usage experts at Quill Corporation, a direct marketer of office products, recommend these tips to alleviate potential eye problems and ease tension: • Have your eyes examined regularly. Tell your eye doctor how long you sit in front of the computer monitor each day. Since tinted eyeglasses sometimes help eyestrain, let your doctor know what color screen and typeface you work with so that the correct color lenses can be prescribed. • Keep glare to a minimum and use a glare screen. Both outside and inside sources can cause glare on your screen. Glare screens are available that offer maxi-

mum glare reduction while still maintaining the brightness of the monitor screen.

• Don't position your screen in front of a window. The contrast caused by trying to focus between outside light and your terminal could cause tension headaches.

• Change your field of vision periodically. Gazing at a distant object forces your eyes to readjust, while maintaining a short, fixed focus too long causes stiffness and tension.

• Take frequent breaks. A good rule of thumb is to spend 15 minutes away from the computer terminal for every two hours in front of it.

• Exercise your eyes. Slowly roll them clockwise three or four times, then reverse the direction.

Blink frequently. Blinking moistens the eyeballs and minimizes itching sensations caused by tired eyes. Also lower the presde sure on your eyeballs by cupping your hands and place them over your eyes for one minute every half hour.

XB program simplifies creation of arc file catalogs

By W. LEONARD TAFFS Most catalog programs provide the option of saving directories in D/V80 format. This makes them mergeable with a program editor if you wish to create an extended file of many directories. These merged directories usually do not append the name of the disk where each file is found, so such a directory is only useful viewed disk by disk. It means looking through each disk directory, one by one, until you find your file or program. This merged directory would be much more useful if it was sorted. However, such an alphabetical version would not be of much use if it did not give the name of the disk on which the file could be found. There are some programs that will do this, such as the early Disklister, though I haven't seen many. Masterdisk is the one I have used, which is not to be confused 7 ith Diskmaster. Masterdisk is a good program but it is slow in executing — especially as its file grows in size. Manipulating files made by Masterdisk is difficult in some key respects and these files, in my experience, can be lost if one inadvertently attempts to load a disk with a blown directory or any embedded file glitch is present in a directory. Also, any files "deleted" by you in Masterdisk are not truly deleted. This has to be considered when viewing file records of a spoiled Masterdisk directory with a sector editor. Wishing for something more flexible than Masterdisk, I wrote my own cataloging program some years ago (DSCN-TODSCN) which appends disknames to filenames. I continue to use it today. Using Masterdisk has the advantage of being a single step process to produce an extended directory, while using a program such as DSCNTODSCN requires three steps: 1. Make individual directories, in my case using DSCNTODSCN. 2. Load these (merge) into a program edir, not a text editor. 3. Sort the composite file. This is not a complicated process and is worth the time, as it is far more flexible than Masterdisk. Incidentally, with regard

to step 2, if you have a large number of archived file catalogs, it might be quicker to use my MASSREAD2 program to merge these files, as compared to loading them one by one into an editor. MASS-READ2 is much easier to use than the earlier version reprinted in MICROpendium.

posite file is sorted.

As the D/V80 arc file catalogs created by Archiver do not append the name of the arc file beside the individual filenames necessary if you intend to assemble several and then sort them — the program below does it for you. Curiously, arc files do not show disk sector capacity, probably only a minor inconvenience to most users. To use the program, you must first have the arc file catalogs saved to disk using Archiver. Then run these file catalogs through the program below. The program does not create a composite file. This is accomplished by merging the files in TI-Writer or other editor. You can load as many such files as your editor or sorting program will handle. Forgive me for mentioning MASSREAD2 again, but MASS-READ2 could make this work much easier by creating this composite arc catalog for you. If using MASSREAD2, just be careful not to make your composite too large for the program you use to do the sorting. The same precaution applies when using

CREATING A COMBINED ARCHIVER CATALOG DIRECTORY

For those who need or are obsessed with large directory catalogs, here is a program that may be of use. It works with files archived using Barry Boone's Archiver program. The more archived programs or catalogs of arc files you've got, the more useful it will be. If you don't maintain a composite file of all your arced programs, the more archived programs you collect the more difficult it becomes to find particular programs. Generally, without a composite catalog, you have to read many catalogs or have to load Archiver and then catalog each arc file until you find what you're looking for. It would be nice to have an extended directory of arc files that shows the names of the archived files and the names of the files in each archived file. Archiver will produce a disk file of any archived file catalog if, when you select the "Catalog Arc File" option, you enter a disk number and filename designation at the "Device" prompt. This comes up when you select "Y" when prompted for a printout. The format of these catalogs is slightly different from the conventional disk catalog. With regard to making a larger, composite file of several such catalogs, this difference is quite significant in terms of the amount of disk space used. Three lines of each archived file can be eliminated a considerable savings of space when creating very large files. The program below deletes these lines and preserves the integrity of the last line by incorporating the number of files and catalog size in the file header. These arc file headers are preceded by an exclamation mark "flag" to separate them from filenames when the com-

an editor.

The following program has been a great convenience to me, so I am glad to share it.

By CAL ZANELLA CYA is a Geneve MDOS-native utility program. The purpose of CYA is to aid the Geneve user to simplify system configuration by supplying a useful tool to individually tailor SYSTEM/SYS to his needs without the use of a sector editor. For many Geneve users, the thought of having to sector-edit the the SYSTEM/SYS file can be an exercise in frustration or confusion. CYA greatly simplifies this task!

CYA is a copyrighted program written by Tim Tesch. It is basically a menu system that is loaded into memory from the MDOS CLI (command line interface) prompt. Once loaded into memory, the CYA menu system allows you to perform a host of tasks that would otherwise require the use of a text editor, a sector editor and much time and forethought. CYA takes care of all this through a n elegant menu system that requires minimal keyboard input from the user. Take note that CYA will only work with MDOS versions 2.20 and 2.21. Fu-

REVIEU

ture versions of MDOS may or may not require a CYA upgrade, depending on code changes within MDOS. Future upgrades to CYA, if necessary, will be made available at a nominal cost.

This program can be described as allowing the user to embed most AUTOEX-EC commands, as well as some hardware configuration parameters, directly into the SYSTEM/SYS file. What follows is a quick rundown on what and how it is accomplished.

The first task is to load CYA into memory. CYA requires 200K of free memory, so if you just have a basic Geneve with no additional memory cards you will need to disable TI MODE in your AUTOEXEC configuration. CYA can be loaded from a RAMdisk, hard drive, floppy drive or a PFM Flashdisk. The documentation that is shipped with the CYA package is quite de-

scriptive, so I intend only to cover utilitarian advantages of the the program. Once loaded into memory, the CYA main menu appears. The menu appears as: (B)atch commands (D)rive remap/assign (H)FDC Information (T)ests (C)alculate CRC (S) ave SYSTEM/SYS (L)oad SYSTEM/SYS (R)eset MDOS configs (M)emory

Each menu item can be accessed by keying in the the corresponding letter enclosed in parentheses. Each letter will display a submenu of additional selections that are specific to the initial selection. Menus are either hierarchical or terminate at an input prompt. The necessary first action involved loading a copy of SYSTEM/SYS into a buffer area set aside by CYA, hence the need for 200K of free memory. SYS (See Page 27)

MICROpendium/December 1994 Page 27

CYA---

(Continued from Page 26) TEM/SYS can be loaded from virtually any external device. You can load in the file along with CYA at the MDOS prompt or you can load CYA first and select the letter (L) at the CYA main menu, type the path and filename at the submenu prompt, press Enter and SYSTEM/SYS will load in after the CRC integrity check is successfully completed. If the version of MDOS that you are attempting to load has been sectoredited previously or is corrupted, CYA will issue a warning and will not load the file into memory. "If SYSTEM/SYS has been modified or corrupted, intentionally or otherwise, CYA will NOT be able to use it" according to CYA documentation). The reason for this lies in the fact that all future releases of MDOS will have the CRC code (Cyclic Redundancy Check) embedded in the MDOS code to help identify the receipt of a possibly corrupted version. Once MDOS is successfully loaded, all menu options are available. Since MDOS is y default hard-coded for the most basic system configuration, this is where CYA begins to shine. Browsing through the menu system will give you an idea of how flexible and useful CYA can be. AUTOEX-EC-driven batch commands can be modified and patched back into the SYSTEM/SYS file. These include the prompt characters, file search path designations, upper/lowercase sensitivity and foreground/background default colors. The DSK1 subdirectory emulation default can

be turned on or off. The default location of the AUTOEXEC file can be specified. Other submenus allow you to change physical and logical drive ASSIGNments, drive REMAPping, LASTDRIVE designation, default drive letter and provision to set hard drive headstep rates.

There are four menus that provide system information or perform tests on external hardware devices. If you are using a Myarc HFDC card, the (H)FDC submenu provides information on the card configuration, i.e. CRU address, EPROM version number, DIP switch settings for floppy drives and HFDC buffer memory capacity. The (T)ests menu will give you access to hardware test routines for your joysticks, bus mouse port and sound generators. A (M)emory menu lists the memory configuration of your Geneve. Slow and fast CPU memory are displayed as well as video memory configuration. If you have a PFM Flashdisk installed, this will also be displayed. If you happen to change several settings during the current session and decide you would like to cancel the changes to start over with a clean slate, simply return to the main menu and select (R)eset MDOS con-

you do a save, a new CRC value is calculated and saved back into MDOS. This will allow you to reload this modified version back into CYA should you decide to make any further changes.

At this point, you may want to edit your AUTOEXEC file to remove any configuration commands that were embedded into MDOS. You should find, as I did, that you will probably end up with a very minimal AUTOEXEC file. I expended considerable effort trying to crash the program, only to be defeated at every turn! This is a well done and most useful utility that complements my Geneve toolkit. Now that I have it, I wouldn't part with it. Documentation that is shipped with the disk is provided on laser printed paper and is clear and complete. Even a novice should have no problem following the concepts presented.

Two final notes:

1. Tim Tesch is adding yet another configuration setup to CYA to allow setting the floppy drive head step rates. This is useful for those who are using a Myarc HFDC as their only controller card, since SETDSK will not work with a HFDC.

2. Tim is also squashing a minor cosmet-

figs. This will reset all configurations to the state that they were when you initially loaded MDOS.

When you finish with all configurations that you intend to make, the final step is to (S) ave SYSTEM/SYS. You have the option of saving to any external device. When ic bug in the routine that reports the head step rate of floppies connected to a Myarc HFDC.

CYA sells for \$15. For information or to order contact: Cecure Electronics Inc., P.O. Box 132, Muskego, WI 53150-0132; phone: 414-679-4343.

MICRO-REVIEWS

Disk of Medieval Times and Risk

about the middle ages and is full of knights

in armor, castles, dragons, jousts, and fair maidens locked up in towers. I just finished reading Arthur Conan Doyle's "The White Company" and this disk set reminds me of the events in Doyle's story. (Yes, (See Page 28)

Starting with this month's column I will list all appropriate names and addresses at the end of the column under the heading Access." This is where you look to find out where to send for the software reviewed here.

TIMES

By Ken Gilliland

This \$15 commercial software is the lat-

est of Ken's theme disk sets. This one is

MICROREVIEWS----

(Continued from Page 27) Doyle wrote about other things besides Sherlock Holmes.)

Medieval Times comes on four SSSD disks and is designed to run out of DSK1 using Extended BASIC. You also get a nicely illustrated, 16-page user guide. The main menu is displayed from the first disk as follows:

A — Tales of Chivalry
B — Legends of Valor (Game)
C — History of the helmet
D — Castles, Keeps, & Towers
E — Exit Medieval Times.

The first test of valor is a joust on horseback against a great big knight. You position your shield and lance high/middle/low and try to knock the other knight off his horse. This requires several tries, with you or the other knight getting wounded each time. When somebody is wounded enough that he can't continue the game ends and, if you are the least wounded, you then heal quickly and go on

Once killed you go to a high score screen where your chosen "Sir _____" name and score are permanently recorded and are then returned to the Medieval Times main menu. If you want to attempt another queen rescue, you have to start again from the beginning of the first test. What is needed is a "save game" feature. The third test of valor is really neat, but you can waste a lot of time trying to get to this third test and if you are killed you have to start all over again with the first test. Since Medieval Times is largely written in Extended BASIC I figured out a way of cheating so that I can start directly with the third test at any time. Each of the valor tests is a stand alone XB program. You can OLD and RUN the third test directly from XB's command mode. C — History of the Helmet shows you a series of TI-Artist pictures, each of which shows several types of medieval helmets. A short description of each helmet accompanies each picture.

When you select these items, you are sometimes prompted to insert another of the four disks into DSK1 in order to continue.

A — Tales of Chivalry displays text files which include legends relating to King Arthur and his knights as well as scholarly discussions concerning the history of these stories. Separate stories about King Arthur, Sir Bors, Sir Gareth, Sir Gawain, Sir Percival, Sir Lancelot, and Sir Erec are included. My favorite texts are the two dealing with the known history of these tales, answering questions such as what is the oldest known reference to King Arthur. As you probably know, the Arthur stories are, in all probability, a mixture of ancient fiction and fact. Very little independent information about Arthur and his knights exists. I was particularly intrigued with the "Holy Grail" legend. Supposedly, the cup Christ used in the last supper was brought to England where it exhibited various magical powers. Lots of time, effort, and money was expended by medieval English important people looking the grail. The source materials Ken used in researching these text files and in creating his medieval artwork are listed in the documentation that accompanies Medieval Times.

to the next game. There really isn't any skill involved here, only luck. There is about a 50 percent chance of winning. The joust is slightly modified from a joust game originally published in *99er Magazine* in the ancient medieval past of the 99/4A, back in 1983.

The second test of valor is similar to the joust except that your opponent is a firebreathing dragon. You adjust your lance and shield position and try to skewer the dragon with your lance as you pass on your horse. The hope is that your shield prevents the dragon's fiery breath from burning you. As with the first test, there doesn't seem to be much skill involved. Chances of slaying the dragon are about 50 percent. The third test of valor really is original and fun. You have to approach the castle in which the queen has been locked, climb the tower, and rescue her. All along the way you have to dodge the arrows and swords of the defenders. Some of these defenders pop out of the ground at sudden and irregular intervals to do you in. Screen graphics are very well done. You get two simultaneous displays. Most of the screen shows you (as a knight) and your immediate surroundings. This display constantly changes as you move from left to right towards the queen's location. In the lower left of the screen you see a map of the whole castle area, with your location on this map indicated. The closer you are to

D — This gives you a slide show of several castles.

E — From the main menu will return you to reality and display the 99/4A title screen. Two of the four disks are completely full of Ken Gilliland's own artwork related to medieval times. The disks are full of TI-Artist pictures, instances and fonts. You really get a lot of artwork for your money because some of the art is archived. What if you don't own TI-Artist? If you don't want to purchase TIA from a dealer, you can use Bruce Harrison's Drawing Program which is public domain and which I will send you if you mail me a buck. TIA instances and fonts can be loaded into and displayed by Drawing Program.

B — The Legends of Valor game is actually three games tied loosely together with a story. The queen is locked up in a

Ken's theme disks are totally 99/4A and Geneve creations. The artwork and software were all created on a 99/4A and the documentation was created using TPA for MDOS. I know of nothing in the IBM-PC world that resembles the unique combination of scholarship and original artwork found in the theme disk sets. Probably anyone can learn from and enjoy Disk of Medieval Times.

tower and you have to rescue her. However, first you have to prove you are worthy of such a rescue attempt by competing in various medieval tests of courage. The three games are supposed to be played in order, and you have to win each in order to go on and play the next game. All three games are written in Extended BASIC.

the queen's location the faster the action. There is a fair amount of skill in this game since you need to know just when to jump or dodge arrows.

My main complaint about these tests of valor is that you are supposed to complete them in order and you only get one chance (one life) to complete all three games.

MICROpendium/December 1994 Page 29

USER NOTES

Getting more lines out of the formatter

The following article originally appeared in newsletter of the Cedar Valley 99ers User Group. It was written by Bob Heiderstadt.—Ed.

Many will remember the article subtitled "Formatter Frustration" that appeared in many TI99/4A newsletters on how to increase the number of lines printed on a page. The article how to increase the number from 58 to 66 using the TI-Writer formatter. The article was written by John Owens of the JUG 99'ers.

His method does the job, but requires eight steps to print a page consisting of up to 66 lines, the number of lines the formatter is set for. Print with one-eighth inch spacing, 88 lines, and you get the same 66 lines with a space left over at the bottom. While producing three genealogy books, I thought that a lot of paper was wasted while using the standard TI-Writer formatter. John's method worked, but it (See Page 30)

READER TO READER

Laurence Topliffe, 2A Jeanette Dr, DeLand, FL 32720, writes:

Can someone please tell me, out of all the checkbook balancing software for the TI, which one is the best — not simplest, but can handle checking account withdrawals, overdrafts and charges and check charges? I function as an independent salesman.

(Continued from Page 28)

RISK By Oliver Arnold

Risk is a Parker Brothers board game I enjoyed playing with my friends when I has a young teenager. The object of the game is to conquer the world with your armies, physically occupying all countries of the world displayed on board game's world map. There is at least one "official" Risk computer version and I have seen a couple of fairware Risk versions for IBM-PCs in CD-ROM collections. Now we 99/4A owners have a nice adaptation of Risk we can use on our machines. The assembly language (EA5) game is for two to six players. It is a game of strategy, not fast action. A joystick is required. The gameboard displays an amazingly detailed, multi-colored mercator projection of the world. The game begins with players entering their names in the upper right corner of the screen. The computer randomly divides the countries of the world among the various players and then allows each player to place his surplus armies (each country already has one army) in the

Each letter is only three pixels wide, with one pixel between letters. This is hard to read on a TV screen. You had better use a monitor. Cute background music plays all the time. You can turn it off by moving the cursor next to the pictured gramophone (the "His master's voice"-type with a big horn-like speaker) and pressing the firebutton.

Risk is an excellent educational tool for learning world geography. You run into some strange country names, particularly within what is now Russia. Several autonomous areas within Russia are treated by Risk as separate countries. I really like this game and am amazed at the detail that is simultaneously squeezes onto the screen. My only complaint is that sometimes all this detail is hard to see. Players 1 and 2 have their countries colored white and gray, colors hard to distinguish from each other. Sometimes the text is hard to read because it is so small. Risk is fairware. Send me \$1 and I'll send it to you to try out. Oliver asks whatever you think it is worth as a fairware donation.

Jerome A. Noel, 209 Martins Creek
 Rd., Bernardsville, NC 28709, writes:

 Is there a way to size the stack memory within a program, e.g., one that
 loops through an array and size until the
 size indicates a predetermined value? I
 have tried with little success. The Editor/Assembler Manual, page 410, refers
 to this problem; however, this is not in
 an assembly program but an Extended
 BASIC program.

□ Alfred Slovak, Fugbachgasse 18/17, A-1020, Vienna, Austria, writes: Since I use MDOS 2.00 I have trouble using Archiver 3.03g and Birdwell's Disk Utilities 4.2. Archiver won't let me work from DSK2 to DSK1. The opposite direction works fine. Also, doing all operations on DSK2 works. But using DSK1 as target, archiving or extracting, causes a red screen and Error Code 3. Sometimes extracting works, I don't know why. DSKU 4.2 does not allow any more the deleting of files. The program displays "Deleting File:FILENAME" but there is no increase of free sectors, and when I catalog again the files are still present. Furthermore, the option View File does not work. It stops with Error, press any key, without even having tried a disk access.

countries under his control. Players attack countries next to the ones already under the player's control, with a roll of the comter dice deciding the outcome of each battle.

Player names, country names, and computer prompts for input are all displayed in teeny-tiny, multi-colored, 64-column text.

MICROpendium/December 1994 Page 30

NNTFS

(Continued from Page 29) was cumbersome. I started experimenting. I found what I believe is an easier method to accomplish the same goal. Plus, allowing many more lines if you use less line spacing and a smaller typestyle, elite or superscript, for example.

The method is essentially a three-step process. Details follow:

1. Defeat the formatter's wasting the top five and bottom three lines of paper. 2. Print the first 58 lines, or fewer, lines of heading and text. 3. Print the remaining lines needed to fill out the page as close to the bottom as you desire. You know that the header (.HE) prompt will print on the third line, and then skip to the sixth line. The problem with the header prompt is nothing except dot commands (.) can precede it. Add a transliterate command (.TL) and a symbol to activate the command, such as expanded type, ahead of the .HE and you lose the header. Most of the time you don't want a header. What to do? Step 1: Make up a simple three-line "dummy" program you will use with each page you want to print using more than 58 lines. Give it a simple file name and save it on each disk for use as needed. The dummy program is as follows: Line 1: (CTRL-U, Shift-Q, CTRL U) Line 2: CR (carriage return) Line 3: (CTRL-U, Shift-S, CTRL-U) That's it. This program, when run through the formatter, will space down six blank lines and turn off the printer motor. You then roll back the paper to where you want printing to start. Step 2: Call up the formatter again and run the text you have prepared. Your text, including all formatter and printer commands, heading, etc. is the same as you normally would prepare when using the formatter. Add a CTRL-U, Shift-S, CTRL-U on the first line of the screen to :-) turn the motor on again. Add a CTRL-U, :-(Shift-S, CTRL-U to turn the motor off as ;-) the last line of text. When the text goes :-D through the formatter, the motor turns on :-0 and starts printing your file. When done, the motor stops. :-Q Note that if you have carriage returns at the start of the text, as mentioned above, :-{) other than after .TL commands (such as

the .TL activator symbol following by a carriage return), that symbol's carriage return will insert a blank line before starting to print. So position your paper to allow for that first linefeed.

Step 3: Call up the formatter again, run Step 3 of your text, prepared the same was as in Step 2. Use the same format, i.e. start motor, add formatter and printer commands, add text, and finish with the stop motor command. This keeps the printer from running out a sheet of blank paper. It is best, and easier, to stop the Step 2 text at the end of a paragraph where you want a following blank line. When preparing text, I include 58 lines of text in Step 2 and 17 lines in Step 3 to add up to 75 lines, with 10/72 inch line spacing. You could do 84 lines with 1/8 inch line spacing. I like to leave two lines at the top and bottom. Experiment to find what you like best.

Making electronic

Computer users say

conversation

We found the following item in Tic Toc, the newsletter of the Rocky Mountain 99ers.—Ed.

When you are "talking" to a friend using email, you can't see each other's faces. Because of this you miss the smiles, winks and frowns that add meaning to conversation and lend context to cold words. Longtime navigators of the information highway developed a substitute called "emoticon." Emoticons are icons reflecting emotion. They are created using combinations of colons, hyphens and other characters and are viewed sideways. Here are some emoticons to get you started:

Smile Frown Wink Big smile Open-mouthed amazement Tongue hanging out in nausea or disgust Smile (user has a moustache)

the funniest things

The following item was written by Earl Raguse and appeared in the User Group of Orange County ROM newsletter. He excerpted it from a column written by Vince Demers in the New Hampshire 99ers newsletter. He in turn got the information from an article in the Wall Street Journal.—Ed.

The exasperated help-line caller said she couldn't get her new computer to turn on. A technician at the computer company asked her to make sure the computer was plugged in and then asked the woman what happened when she pushed the power button.

"I have pushed and pushed on this foot pedal and nothing happens," the woman said. "Foot pedal?" the technician asked. "Yes," the woman said. "This little white foot pedal with the ON switch." The "foot pedal" turned out to be the computer's mouse. (See Page 31)

NOTES CLASSIFIEDS

(Continued from Page 30)

There were many more equally stupid calls reported. A woman called to find out how to insert the batteries in her new laptop. When told that the instructions were on the first page of the manual, she said, "I just paid \$2,000 for this damn thing and I am not going to read a book."

Many calls were made by people who couldn't find the "any" key. One man was insulted when the computer said "bad command" and "invalid." The technician had to tell him not to take it personally. One person called to complain that his keyboard no longer worked, even after he had carefully cleaned it by soaking it in the bathtub over night. Another called to say he was unable to "fax" anything using the computer's fax modem. It turned out he was holding a piece of paper in front of the monitor and hitting the print screen key.

FOR SALE

FOR SALE

2 complete TI systems & many accessories for sale. For price list, write Larry Harpring, 645 Five Notch Rd., North Augusta, SC 29841 or call (803) 278-4606 after 6 p.m. v11n11
